Important notice

Read this first

This guide is educational and informational only. It is not investment advice, a guarantee of future results, or a recommendation to buy or sell any security. 13F filings are delayed snapshots, so every thesis should be checked against current price action, fundamentals, liquidity, and your own risk limits.

Contents

1. Introduction to 13F Filings	What filings mean, why the 45-day lag matters
2. Core Whale Profiles	The managers worth tracking and what they tend to buy
3. The 4-Step Analysis Framework	How to screen for conviction and cluster rotations
4. Quantitative Execution	Timing, sizing, stops, and risk control
5. Terminal Commands	Fast shortcuts for the Stock Bloc workflow
6. 30-Day Research Workflow	A repeatable process for filing review
7. Whale Tracking Scorecard	A simple ranking matrix for better decisions

Section 1. Introduction to 13F Filings and Institutional Money Flow

Form 13F is a quarterly report filed with the SEC by large institutional investment managers. It is one of the cleanest publicly available windows into how major capital allocators are positioning around macro themes, secular winners, and defensive hedges.

The key thing to remember is that 13F data is delayed. Institutions generally have up to 45 days after each calendar quarter ends to file. That lag means you are not watching live trading, you are watching accumulated conviction. Humans do love pretending delayed data is useless because patience is apparently a niche skill.

A good 13F process does not chase every line item. It separates signal from noise by focusing on long-only equity exposure, meaningful portfolio weights, and repeated buys across independent funds. Small option positions, hedges, and tiny tracking allocations should not be treated as high-conviction buy signals.

Best practice filter

Focus on positions that are long-only equity allocations, are at least 2% of the manager's portfolio, and appear in more than one reporting cycle or across multiple managers.

Section 2. Core Whale Profiles and Strategic Thematics

Cathie Wood and ARK Invest

ARK tends to focus on disruptive innovation: AI compute infrastructure, robotics, autonomous mobility, genomics, digital assets, and software platforms that can scale faster than old-economy business models.

Stanley Druckenmiller and Duquesne Family Office

Druckenmiller is best studied as a macro allocator. He tends to size around regime shifts, liquidity cycles, AI hardware demand, energy bottlenecks, and major changes in consensus expectations.

Tiger Global Management

Tiger is often associated with software, cloud infrastructure, internet platforms, and high-margin enterprise models where growth and operating leverage can compound quickly once the product-market fit is real.

Warren Buffett and Berkshire Hathaway

Berkshire is the opposite of hype. It is a lesson in balance sheet strength, durable moats, predictable cash flow, and patient ownership of businesses that can survive every economic mood swing humans invent.

Section 3. The 4-Step 13F Analysis Framework

- 1 **Step 1: Load the filing.** Pull the newest 13F from SEC EDGAR or your Stock Bloc 13F Intel module so you are always using the latest quarter available.
- 2 **Step 2: Isolate new buys and exits.** A new position may reveal fresh conviction. A full exit can signal a thesis change, a risk reduction move, or simply portfolio maintenance.
- 3 **Step 3: Score the weight.** Positions above 5% of portfolio value usually matter a lot more than positions below 0.5%. Weight concentration is often more useful than the raw ticker list.
- 4 **Step 4: Track sector clusters.** When multiple independent managers begin buying the same industry at once, the move may reflect a broader rotation, not just one lucky fund manager having a good hair day.

What the cluster means

If Druckenmiller, Tiger, and other unrelated funds all start showing fresh exposure in the same theme, treat that as a rotation alarm. The edge comes from recognizing the pattern early, not from worshipping any single ticker.

Section 4. Quantitative Execution and Retail Risk Management

Never copy a 13F blindly. By the time retail sees the filing, price may already reflect part of the move. Use the filing as a research map, then check technicals, valuation, and market context before placing capital.

- **Entry timing:** Use RSI or a similar momentum gauge. Many traders prefer entries when RSI is closer to 40-50 rather than above 70, because overbought conditions can make pullbacks violent.
- **Position size:** Keep each follow-trade small, usually 2% to 5% of total portfolio value.
- **Risk control:** A trailing stop around 10% to 12% below entry is a common guardrail for volatile growth names, but it should match your strategy and tolerance.
- **Context check:** Confirm earnings date, guidance risk, liquidity, and sector news before treating a whale buy like gospel.

Retail rule

The goal is not to mimic institutions. The goal is to piggyback on their research while keeping your own risk tight enough to survive volatility.

Section 5. Stock Bloc Terminal Commands

- **13F ARK** - Load Cathie Wood's top holdings and quarterly changes.
- **13F DUQUESNE** - Load Stanley Druckenmiller's portfolio weights.
- **ANR [TICKER]** - Review analyst consensus ratings and target prices.

- **FA [TICKER]** - Run fundamental analysis including P/E, revenue growth, and margins.

Why this works

The terminal is designed to compress the research loop: filing review, ticker screening, and thesis checks in one workflow. Less tab-hopping, less confusion, fewer excuses.

Section 6. A 30-Day 13F Research Workflow

- 1 **Day 1:** Pull the newest filing and isolate all new positions.
- 2 **Day 2:** Rank positions by portfolio weight and note any outsized concentration.
- 3 **Day 3:** Cross-check the ticker against earnings date, valuation, and recent price trend.
- 4 **Day 4:** Build a watchlist of 5 to 10 names that actually deserve more research.
- 5 **Day 5:** Watch for second-derivative confirmation from other independent managers.

Workflow goal

This schedule keeps you from turning one filing into a 12-hour rabbit hole. Research should create decisions, not just more tabs.

Section 7. Whale Tracking Scorecard

Factor	Score 1	Score 3	Score 5
Portfolio weight	Under 0.5%	1% to 3%	Above 5%
Number of funds	One holder	Two holders	Multiple independent funds
Theme strength	Isolated name	Sector cluster	Clear macro rotation
Technical setup	Overbought	Neutral	Pullback or constructive base

How to use it

A higher score does not mean “buy now.” It means the name deserves deeper work, better timing, and cleaner risk management.
